

Environmental Quality Incentives Program Water Quality and Soil Health Screening Tool

Introduction

The Environmental Quality Incentives Program (EQIP) Water Quality and Soil Health Screening Tool provides a method to screen EQIP applications. The tool is intended to be used prior to ranking EQIP applications as a way to screen out applications that are medium or low priority so time is not spent ranking EQIP applications that may not be funded. The screening process is a two part process. The first part is to digitize and assign Program Contracts System (ProTracts) generated application numbers to all Water Quality and Soil Health EQIP applications. A set of digitizing and attribution tools will be used to complete this part. The second part which occurs after all applications have been added into the screening boundary dataset will be done at the state office. The applications each management unit (MU) has digitized will be copied to the state office and grouped by ranking category of EQIP Water Quality and EQIP Soil Health. Each application within a ranking category will be assigned a priority of High, Medium, or Low. The state office will provide one report for each ranking category to the area office and MU office. The reports will include the priority ranking status for each application in the ranking category for the MU.

Opening the Screening Map Document

The Kansas Conservation Programs Geographic Information System (GIS) Interface (CPGI) Screening toolbar has been added to accommodate development of EQIP application boundaries for screening. The toolbar consists of 8 tools that allow a user to digitize or copy land units from another source, such as the Common Land Units (CLU) boundaries, attribute the digitized boundaries with the application information, and delete applications from the screening boundaries dataset.

Editing

Select Land Unit

Land Unit

Copy Land Unit

Stop Editing

Draw Land Unit

Attribute Land Units

Delete Application

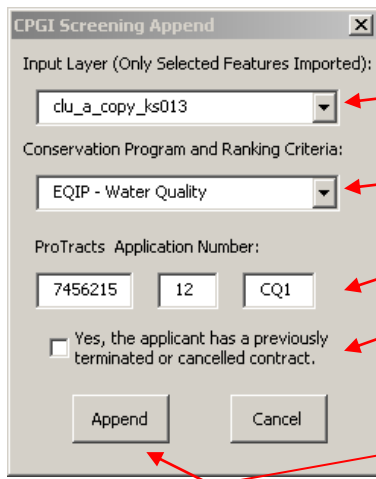

1. Open the EQIP Screening.mxd file by using Windows Explorer to browse to the f:\geodata\project_data\nrcs\NRCS_Programs_Data directory and double clicking on the EQIP_Screening.mxd file.
2. Right click in the grey area at the top of the ArcMap document, then go down to Kansas CPGI Screening and left click on it to turn the EQIP screening digitizing tools on.

3. Using the Kansas Load  data tool, load the CLUs and PLSS data themes for the county you will be digitizing EQIP applications for.
4. Zoom into the application area. This can be done using the zoom tool to zoom to a legal description or a tract number.

Copying Boundaries into the EQIP Screening layer

If you have CLU boundaries that match the application area for EQIP you can:

1. Use the Select Land Unit button  in the Kansas CPGI Screening tool bar to select CLU boundaries from the CLU layer that represent the application boundaries for the EQIP application.
2. Click on the copy land unit button  to copy the selected CLU boundaries into the EQIP screening boundaries dataset. Fill out the CPGI Screening Append form

The screenshot shows the 'CPGI Screening Append' dialog box. Red arrows point to the following elements:

- Input Layer (Only Selected Features Imported):** A dropdown menu showing 'clu_a_copy_ks013'.
- Conservation Program and Ranking Criteria:** A dropdown menu showing 'EQIP - Water Quality'.
- ProTracts Application Number:** Three input fields containing '7456215', '12', and 'CQ1'.
- Yes, the applicant has a previously terminated or cancelled contract.** An unchecked checkbox.
- Append** and **Cancel** buttons at the bottom.

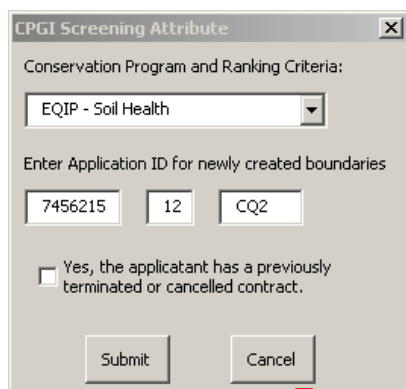

Digitizing New Boundaries into the EQIP Screening layer

If you do not have CLU boundaries that accurately represent the application area then the user will have to digitize the boundaries in using the tools in the Kansas CPGI screening tool bar.

1. Once you have zoomed in and are ready to start digitizing, click on the  button in the Kansas CPGI screening toolbar. **Make sure you click on the start editing tool in the Kansas CPGI Screening toolbar not the Toolkit toolbar.**
2. Click on the Land Unit digitizing button  to add an application boundary into the Screening boundary dataset. This tool functions the same as the Toolkit add field button so you should be familiar with the characteristics of this digitizing tool.

If a land unit needs to be split, use the Split Land Unit tool  on the Kansas CPGI screening toolbar to split a selected land unit. Again, this tool functions the same as the Toolkit Split Land Unit tool.

- Once all of the land units have been digitized in for an application area click on the stop editing button .
- Using the Select Land Unit button  select **all** land units associated (**make sure all land units for the application area are selected**) with the EQIP application area and click the Attribute Land Units button . Fill out the CPGI Screening Attribute form.

CPGI Screening Attribute

Conservation Program and Ranking Criteria:

EQIP - Soil Health

Enter Application ID for newly created boundaries

7456215 12 CQ2

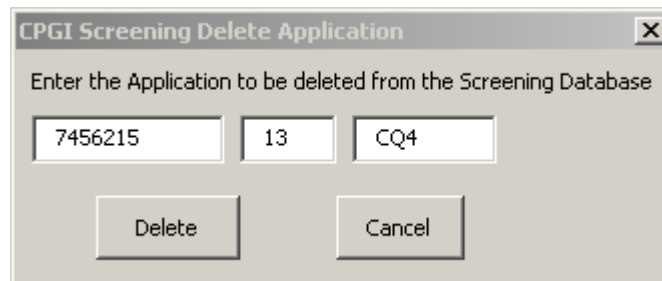

☐ Yes, the applicant has a previously terminated or cancelled contract.

Submit Cancel

- Select the Ranking
- Enter a Protracts application
- Check the box if the applicant has a previously terminated or cancelled
- Click the submit button to copy the boundaries into the screening dataset.

Deleting Applications from the EQIP Screening layer

- Click the Delete Application button .
- Enter the Application you want to delete in the CPGI Screening Delete Application dialog box.
- Click the Delete button.

CPGI Screening Delete Application

Enter the Application to be deleted from the Screening Database
